Under Supervision of :

- Dr. Rafik Alkowafi.
- Dr. Abdelmonem AbdeInabi.
- Dr. Omar Alhuni.
- Dr. Malek Abdulmatlob.
- Dr. Khadiga Elfallah.
- Dr. Randa Elhassi.
- Dr. Nuha Elkadiiki.
- Dr. Amal Elawami.
- Dr. Masoud Deihoum.
- Dr. Ali Bosnina.
- Dr. Asma Benhariz.

Personal Data

- Patient Name : H.M.F
- Date of birth : 14/1/1974
- Gender : Male
- Occupation : IT faculty member
- Address :Jamal-street/benghazi
- Nationality : Libyan

Chief complaint

Pain in the upper left backward side of the jaw started 1 week ago.

History of chief complain

Mild intermitted well localized dull pain that started when patient bite on the tooth and relived spontinously after removal of stimuli, no analgesics were taking , doesn't disturb at sleep, no associated signs and symptoms.

➤ Medical History

- Medically fit with no past or current medical disease.
- Systemic review: **No abnormality detected**

➤ Drug History

- No medication was taken neither now or in the past.

➤ Allergic History

- There is no past or current known allergy

➤ Dental History

- Last visit : Four month ago.
- History of Extraction / Restoration / RCT (**with no complications**).
- No abnormal, destructive habits.

➤ Family History

- Hypertension from father's side.

➤ Social History

- Married / have 2 child.
- Non smoker nor alcoholic.

Clinical Examination

➤ Extra Oral

- ✓ Face symmetry : symmetrical.
- ✓ Skin : Normal color, no scars.
- ✓ TMJ : Average mouth opening, No tenderness, clicking, deviation or dislocation detected.
- ✓ Lymph nodes : Not palpable.
- ✓ Lips : competent.
- ✓ Dental relation to facial mid line : coinciding.
- ✓ Facial profile : Straight.

Clinical Examination

➤ Intra Oral

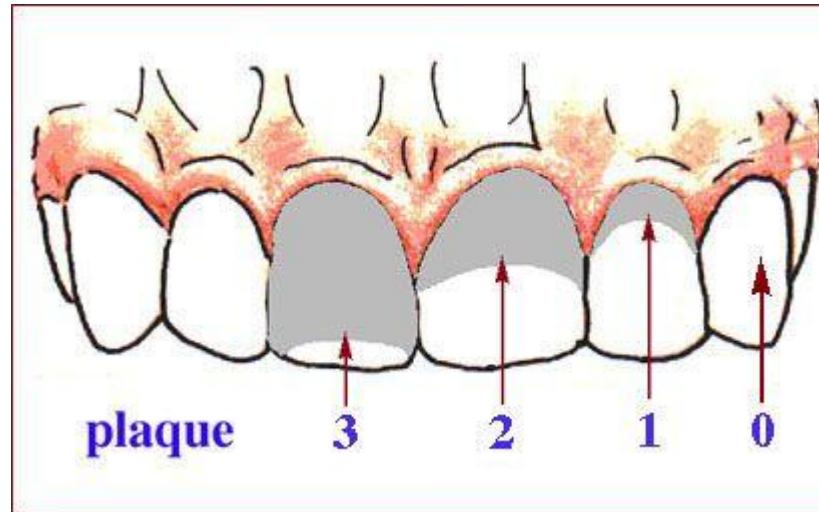

- ✓ Oral mucosa : Normal.
- ✓ Tongue and palate : Normal.

Clinical examination

Oral hygiene index-simplified.

Plaque

16	11	26
1	0	1

Position	At CEJ	At CEJ	Coronal CEJ
Bleeding	Present	Present	Present
Exudation	Absent	Absent	Absent

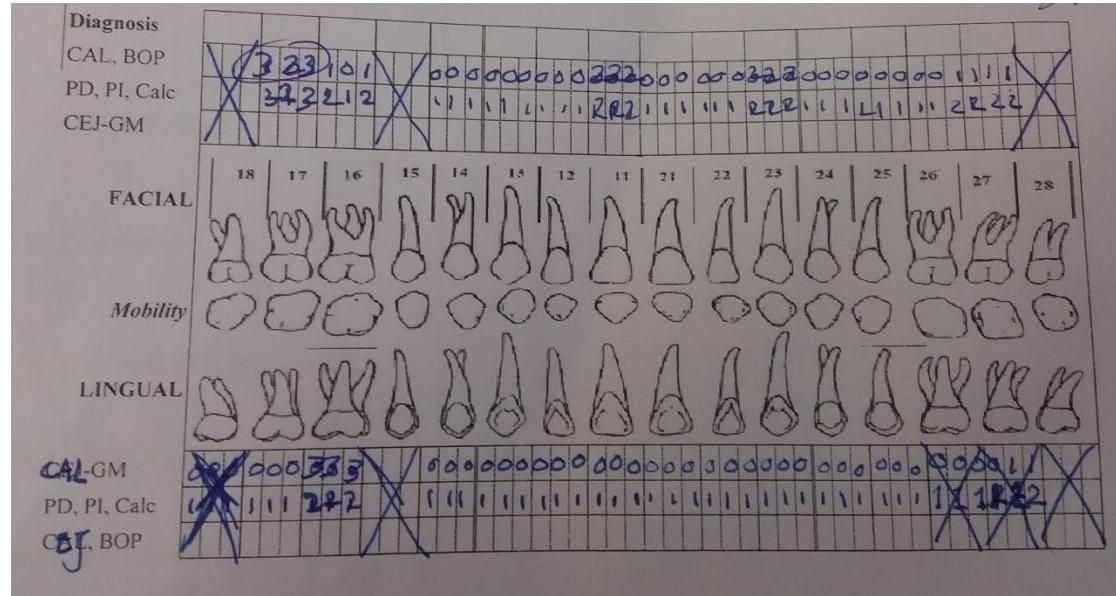

Gingival Status

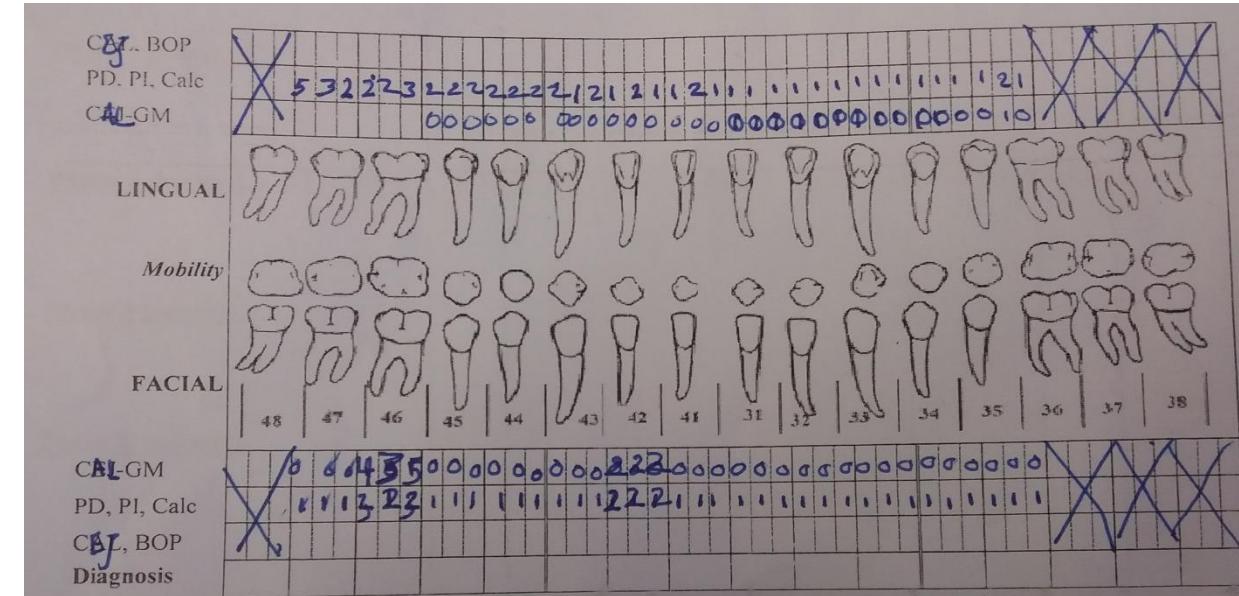

- Frenal attachment : Normal.
- Fermitus test : -ve.
- Attached gingiva : Adequate (4mm).

Periodontal status

Upper arch

Lower arch

Periodontal finding :

Clinical attachment loss generally is : 2-3mm

No mobility

No furcation involvement.

Diagnosis: chronic localized mild periodontitis.

Overall prognosis: Good.

Treatment Plan

- Emergency Phase
 - Pulp extirpation

+ 6

- Phase I Therapy:

- ✓ Pit and fissure sealant

5 4 | 4

Treatment Plan

➤ Phase II Therapy

- Extraction 5 | 8

- Flap reflection to restore cervical decayed related to 3

Treatment Plan

➤ Phase III Therapy

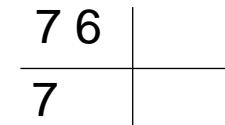

- RCT

- Endo retreatment

- Composite restoration

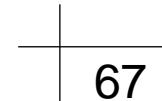

- Post, core and crown

- Implant Replacement

- Replacement of missing teeth (class III Kennedy) with RPD

Treatment Plan

- Phase IV Therapy/ Maintenance & Recall every 6 months.

Patient Consent about the treatment is obtained.

Pre-operative Photographs

➤ Emergency Phase

- ✓ Removal of old restoration
- ✓ Access cavity
- ✓ Pulp extirpation

➤ Phase I Therapy

- Pit and fissure sealant

5 4 | 4

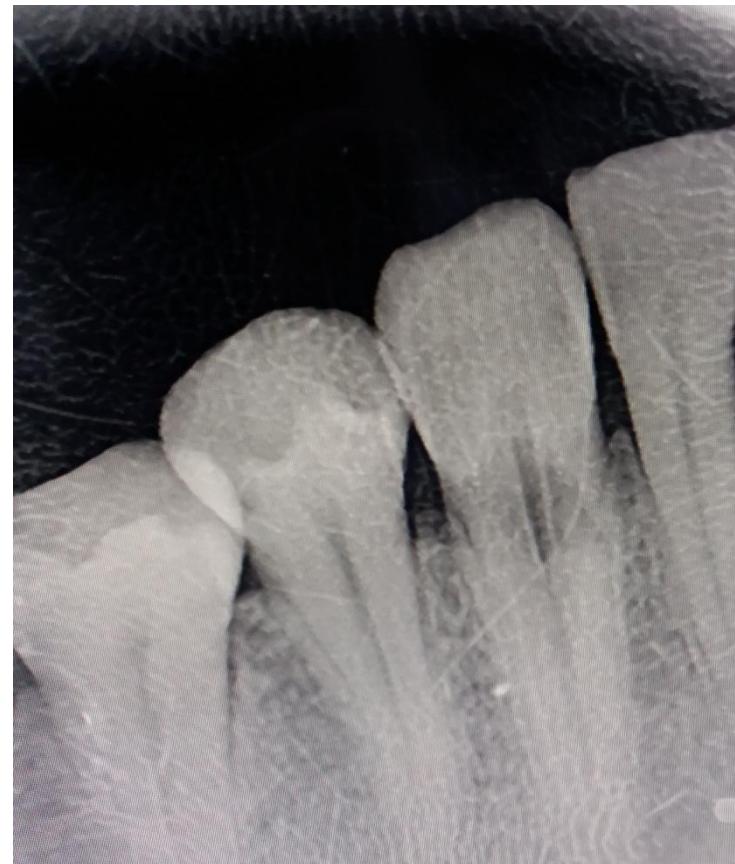

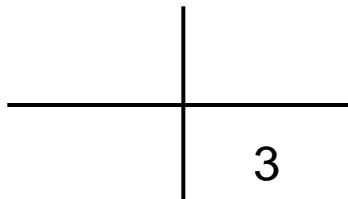

Re-evaluation of Phase I Therapy

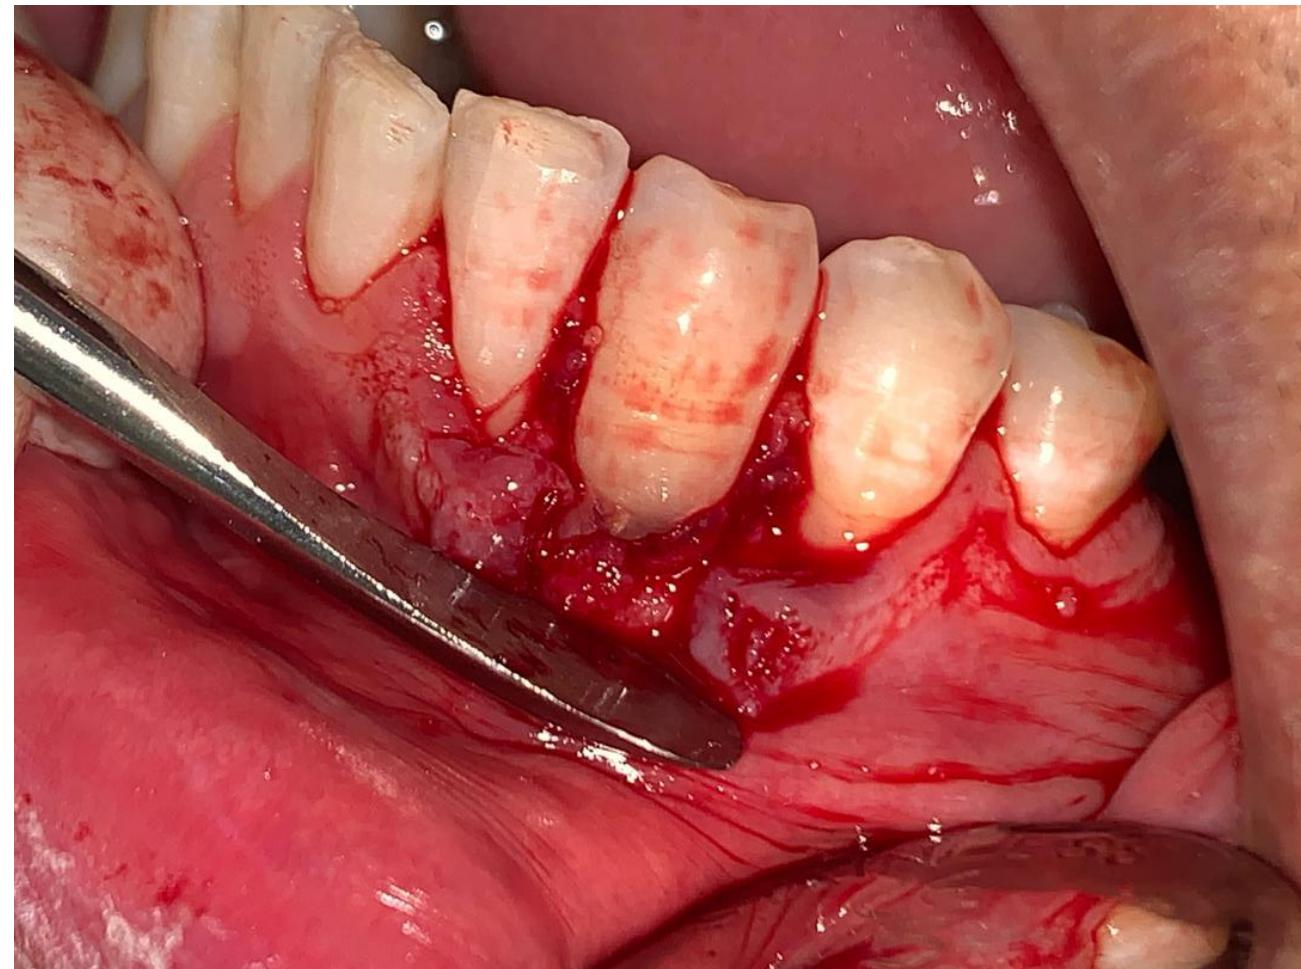

- Improvement of oral hygiene.
- Improved gingival status.
- Less bleeding upon probing.
- Loss of attachment: 1-3 mm.
- Furcation: No furcation involvement.
- Mobility: No mobility.
